

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

CLASSIFIED NOMENCLATURE

INTRODUCTION.

The purpose of this classified nomenclature is to form a basis for a diagnosis index of patients treated in dispensary and hospital work, the immediate objects being to make the clinical material of the Central Free Dispensary more available for study and demonstration and to stimulate students to greater care in the use of diagnostic terms. In the present state of medical knowledge a perfect scientific classification or nomenclature of diseases is impossible. The aim has been to furnish a practicable, uniform terminology to be used in all of the departments of the Dispensary.

The two chief divisions are the General Diseases and the Diseases of Systems and Organs. The former are grouped according to etiology and include diseases caused by Animal Parasites, General Infectious Diseases, with a complete outline of organs affected by Gonorrhea, Syphilis and Tuberculosis; the Constitutional Diseases, including many of obscure etiology; Poisons and Intoxications; General Injuries, and Tumors. The diseases of Systems and Organs are arranged alphabetically under each organ, and the organs of each system are arranged in anatomical order, except where an alphabetical order would lead to no incongruity, as under the Blood and Ductless Glands. The diseases of the Nervous System are in alphabetic order, although advantage is taken of the terms to group the diseases of the meninges, cerebrum, cerebellum, bulb, spinal cord, etc. The diseases of the skin are grouped upon a pathologic basis.

The names of symptoms are used frequently. These serve three purposes: first, no other diagnosis can be made in some instances; second, a certain symptom may be so prominent a feature in some cases as to make it desirable to keep an account of it for future reference; third, they are a means of registering complications. For example, in hemorrhage of intestines in typhoid fever, the case may be registered under typhoid fever and also under hemorrhage of intestines. Symptoms should never be used, however, as the chief diagnosis when a more complete one can be made.

Obviously the same term may occur in the list of diseases of a single organ and also under the General Diseases, e. g., "Abscess, Amebic (see Animal Parasites)" is under Diseases of the Liver and also under Animal Parasites, and "Rheumatism, Acute Articular (see Infectious Diseases)" is among the diseases of joints and also in the General Infectious Diseases.

INTRODUCTION.

In such instances the parenthetical reference is made to one place. Thus all cases of amebic abscess of the liver are registered under Animal Parasites, and all cases of Acute Articular Rheumatism under General Infectious Diseases. Again, among the diseases of the Nervous System is found "Rib, Cervical (see also Bones, Malformations)." This indicates that a case of cervical rib showing involvement of the nerves should be registered under this heading in the nervous system and also under this heading in malformations of bones. When a term has been used in more than two places, all are referred to the same one in order that all cases of that kind shall be registered one card and readily found.

All General Diseases whose names may occur in a system or organ are to be registered also under their respective title in the list of General Diseases. Gonorrhea, Syphilis and Tuberculosis are thought to be of sufficient special interest to warrant a separate registration in groups according to the organs in which the disease occurs and should always be registered not only under the systems and organs but also in this special outline.

Malformations and malpositions are listed under the various organs involved, under the diseases of the New-Born Infant, and under Constitutional Diseases.

The following details do not apply to hospital work, but illustrate the mode of procedure in the dispensary. Upon entering the Dispensary for the first time a patient receives a ticket which he is always to bring with him on later visits. Upon this ticket is a number, there being but a single series of numbers for the whole Dispensary. Upon this ticket are also the patient's name, address and the name of the department to which he is first referred. From the record clerk he receives a large card upon which is written his number, name, age, address, occupation, and department and upon which his record is to be written and signed by the physician. Upon a small card is written his name, number and address, and the date, this card to be kept in alphabetical order in a separate name index. When the patient returns, after examination, to the record clerk, the latter files the history in the order of its number, and the number of the case is written upon the card from the diagnosis index which represents the disease named on the history card. This results in establishing three files: First, the file of the history cards themselves in the order of their numbers, forming a chronological index; second, the diagnosis index consists of one card for each disease named in the nomenclature and arranged in the exact order of the nomenclature, and upon each card is the number of all cases of that disease; third, the alphabetical name index, each card representing a patient with his name, address and number, and the date of his admission.

For the successful application of this scheme for record keeping, it is found essential that a diagnosis be made as soon as possible; that the

INTRODUCTION.

terms of the diagnosis conform to the terms of the nomenclature; that the physician sign the record; that the history card be returned to the office of the Dispensary, that the records of later examinations in various departments be attached to the original history card.

In the compilation of this nomenclature free reference has been made to the Manual of International Classification of Causes of Death as adopted by the United States Census Bureau, to The Nomenclature of Diseases drawn up by a Joint Committee appointed by the Royal College of Physicians of London and to various text books and monographs. The pleasure and value of the work has been greatly increased by the hearty co-operation of various members of the Faculty of Rush Medical College and to them I extend my sincere thanks.

Chicago, March 27, 1909.
